# Elements

- Science has come along way since Aristotle's theory of Air, Water, Fire, and Earth.
- Scientists have identified 90 naturally occurring elements, and created about 28 others.

# [ Elements ]

- The elements, alone or in combinations, make up our bodies, our world, our sun, and in fact, the entire universe.

The most abundant element in the earth's crust is oxygen.

# [ Periodic Table ]

- The periodic table organizes the elements in a particular way. A great deal of information about an element can be gathered from its position in the period table.
- For example, you can predict with reasonably good accuracy the physical and chemical properties of the element. You can also predict what other elements a particular element will react with chemically.
- Understanding the organization and plan of the periodic table will help you obtain basic information about each of the 118 known elements.

# Key to the Periodic Table

- Elements are organized on the table according to their atomic number, usually found near the top of the square.
  - The atomic number refers to how many protons an atom of that element has.
  - For instance, hydrogen has 1 proton, so its atomic number is 1.
  - The atomic number is unique to that element. No two elements have the same atomic number.

# What's in a square?

- Different periodic tables can include various bits of information, but usually:
  - atomic number
  - symbol
  - atomic mass
  - number of valence electrons
  - state of matter at room temperature.

# [ Atomic Number ]

Bohr Model of Hydrogen Atom

- This refers to how many protons an atom of that element has.
- No two elements, have the same number of protons.

Wave Model

# [ Atomic Mass ]

- Atomic Mass refers to the “weight” of the atom.
- It is derived at by adding the number of protons with the number of neutrons.

This is a helium atom. Its atomic mass is 4 (protons plus neutrons).

What is its atomic number?

- View CD-ROM Atoms and Elements

# Atomic Mass and Isotopes

- While most atoms have the same number of protons and neutrons, some don't.
- Some atoms have more or less neutrons than protons. These are called isotopes.
- An atomic mass number with a decimal is the total of the number of protons plus the *average* number of neutrons.

# [ Atomic Mass Unit (AMU) ]

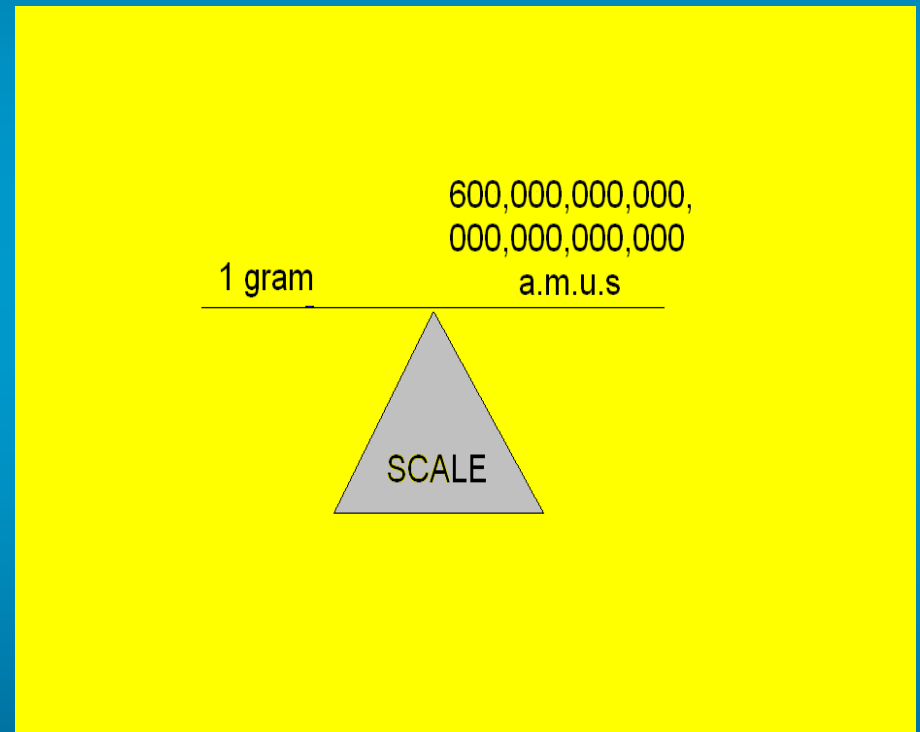

- The unit of measurement for an atom is an AMU. It stands for atomic mass unit.
- One AMU is equal to the mass of one proton.

# [ Atomic Mass Unit (AMU) ]

- There are  $6 \times 10^{23}$  or 600,000,000,000,000,000,000,000 amus in one gram.

- (Remember that electrons are 2000 times smaller than one amu).

# [ Symbols ]

C

Carbon

Cu

Copper

- All elements have their own unique symbol.
- It can consist of a single capital letter, or a capital letter and one or two lower case letters.

# Common Elements and Symbols

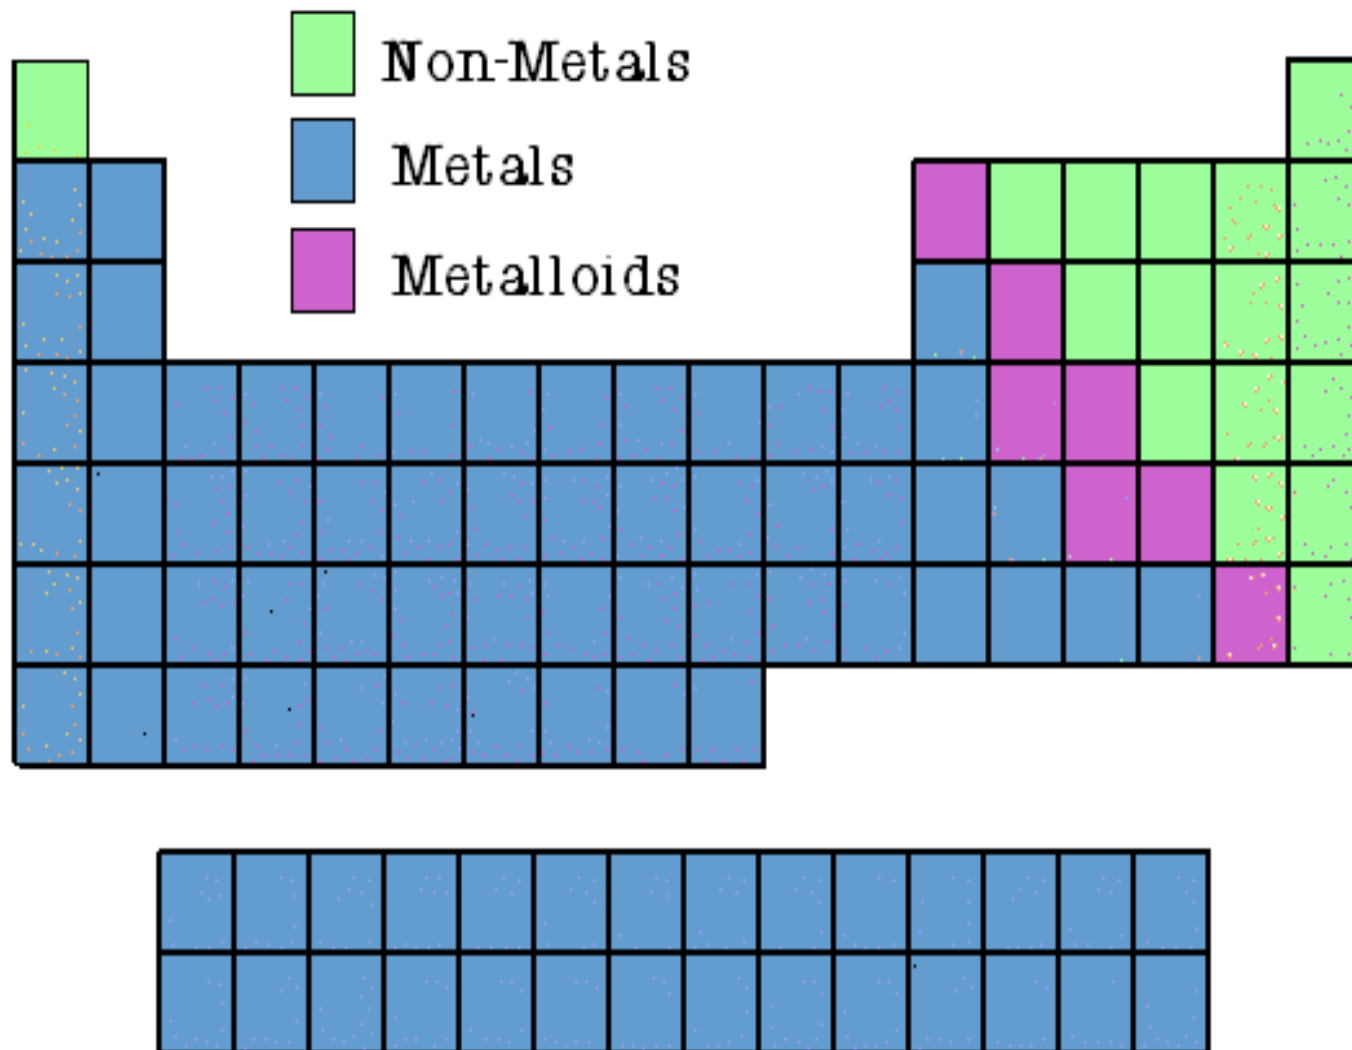

<i><b>Element</b></i>	<i><b>Symbol</b></i>	<i><b>Element</b></i>	<i><b>Symbol</b></i>
<b>Nitrogen</b>	<b>N</b>	<b>Potassium</b>	<b>K</b>
<b>Sodium</b>	<b>Na</b>	<b>Copper</b>	<b>Cu</b>
<b>Chlorine</b>	<b>Cl</b>	<b>Hydrogen</b>	<b>H</b>
<b>Carbon</b>	<b>C</b>	<b>Helium</b>	<b>He</b>
<b>Cobalt</b>	<b>Co</b>	<b>Iron</b>	<b>Fe</b>
<b>Neon</b>	<b>Ne</b>	<b>Niobium</b>	<b>Nb</b>
<b>Gold</b>	<b>Au</b>	<b>Mercury</b>	<b>Hg</b>
<b>Silver</b>	<b>Ag</b>	<b>Boron</b>	<b>B</b>
<b>Oxygen</b>	<b>O</b>	<b>Fluorine</b>	<b>F</b>

# [ Valence Electrons ]

- The number of valence electrons an atom has may also appear in a square.
- Valence electrons are the electrons in the outer energy level of an atom.
- These are the electrons that are transferred or shared when atoms bond together.

The elements of the periodic table can be divided into three main categories: Metals, Non-Metals, and Metalloids.

# [ Properties of Metals ]

- Metals are good conductors of heat and electricity.
- Metals are shiny.
- Metals are ductile (can be stretched into thin wires).
- Metals are malleable (can be pounded into thin sheets).
- A chemical property of metal is its reaction with water which results in corrosion.

# [ Properties of Non-Metals ]

Sulfur

- Non-metals are poor conductors of heat and electricity.
- Non-metals are not ductile or malleable.
- Solid non-metals are brittle and break easily.
- They are dull.
- Many non-metals are gases.

# Properties of Metalloids

Silicon

- Metalloids (metal-like) have properties of both metals and non-metals.
- They are solids that can be shiny or dull.
- They conduct heat and electricity better than non-metals but not as well as metals.
- They are ductile and malleable.

# Families

- Columns of elements are called groups or families.
- Elements in each family have similar but not identical properties.
- For example, lithium (Li), sodium (Na), potassium (K), and other members of family IA are all soft, white, shiny metals.
- All elements in a family have the same number of valence electrons.

# Periods

- Each horizontal row of elements is called a period.
- The elements in a period are not alike in properties.
- In fact, the properties change greatly across even given row.
- The first element in a period is always an extremely active solid. The last element in a period, is always an inactive gas.

]

# Families

# Periodic Table of the Elements

A schematic periodic table grid with 7 rows and 18 columns. The first column is highlighted in yellow. The top row has a gray cell in the first column and a gray cell in the 18th column. The second row has a gray cell in the first column and gray cells in the 13th through 17th columns. The third row has a gray cell in the first column and gray cells in the 13th through 17th columns. The fourth through sixth rows have gray cells in the first column and gray cells in the 13th through 17th columns. The seventh row has gray cells in the first column and gray cells in the 13th through 17th columns. The cells in the second through sixth rows contain patterns of dots: purple dots in the first two columns, blue dots in the next two columns, orange dots in the next two columns, and pink dots in the last two columns.

A schematic periodic table grid with 2 rows and 14 columns. All cells are gray and contain a pattern of blue dots.

# Periodic Table of the Elements

A stylized periodic table grid with 7 rows and 18 columns. The grid is divided into several regions: a blue region in the first column (rows 2-6), a purple region in the second column (rows 2-6), a grey region in the first column (rows 1, 3-7), a grey region in the second column (rows 1, 3-7), a grey region in the top-right corner (rows 1-2, columns 13-18), a grey region in the middle-right (rows 3-6, columns 13-18), and a grey region in the bottom-right (rows 3-6, columns 11-12). Scattered dots are present in various cells: orange dots in the grey cells of the first two columns; purple dots in the grey cells of the middle-right and bottom-right regions; and blue dots in the grey cells of the middle-right and bottom-right regions.

A rectangular grid consisting of 14 columns and 2 rows. All cells in the grid are grey and contain scattered blue dots.

# Periodic Table of the Elements

A schematic periodic table grid consisting of 7 rows and 18 columns. The grid is divided into several sections: a leftmost column (1 column), a second column (1 column), a block of 10 columns (columns 3-12), a highlighted yellow column (column 13), a block of 4 columns (columns 14-17), and a rightmost column (column 18). The cells contain various colored dots: orange dots in the first column, purple dots in the second column, blue dots in the 10-column block, and orange dots in the 4-column block. The highlighted yellow column is empty.

A separate grid consisting of 2 rows and 14 columns. All cells in this grid contain blue dots.

# Periodic Table of the Elements

A schematic periodic table grid with 7 rows and 18 columns. The grid is divided into several sections: a left block (columns 1-2), a central block (columns 3-10), a right block (columns 11-18), and a bottom block (columns 1-10). The top-right cell of the right block (row 2, column 18) is highlighted in yellow. The left block contains orange dots in the first column and purple dots in the second column. The central block contains purple dots in the first and tenth columns and blue dots in the second through ninth columns. The right block contains purple dots in the first and tenth columns and blue dots in the second through ninth columns. The bottom block contains blue dots in all 10 columns.

A separate 2x14 grid of cells, all containing blue dots.

# Periodic Table of the Elements

A stylized periodic table grid. The grid is composed of several rows and columns of cells. The top row has 1 cell on the left and 1 cell on the right. The second row has 2 cells on the left and 5 cells on the right. The third row has 2 cells on the left and 5 cells on the right. The fourth row has 16 cells in a single row. The fifth row has 16 cells in a single row. The sixth row has 16 cells in a single row. The seventh row has 10 cells in a single row. The rightmost column of the grid is highlighted in orange. The other cells are light gray. Scattered dots of various colors (orange, purple, blue) are present in many of the cells.

A rectangular grid consisting of 2 rows and 10 columns of cells. All cells are light gray. Scattered blue dots are present in many of the cells.

# Periodic Table of the Elements

A stylized periodic table of elements represented by a grid of gray cells. The grid is arranged in 7 rows and 18 columns. The first two columns are on the left, and the last two columns are on the right, with a gap in the middle. The cells contain small clusters of colored dots: orange and yellow dots in the first column, purple dots in the second column, and a mix of purple, orange, and blue dots in the remaining columns. The dots are arranged in a pattern that suggests the periodicity of elements.

A horizontal grid of 14 blue cells, arranged in two rows of seven cells each. The cells are filled with a light blue color and contain small clusters of purple dots.

# [ Hydrogen ]

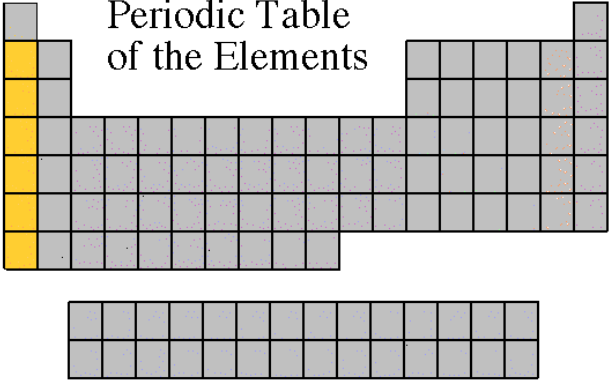

- The hydrogen square sits atop Family AI, but it is not a member of that family. Hydrogen is in a class of its own.
- It's a gas at room temperature.
- It has one proton and one electron in its one and only energy level.
- Hydrogen only needs 2 electrons to fill up its valence shell.

# Alkali Metals

- The alkali family is found in the first column of the periodic table.
- Atoms of the alkali metals have a single electron in their outermost level, in other words, 1 valence electron.
- They are shiny, have the consistency of clay, and are easily cut with a knife.

Periodic Table of the Elements

# [ Alkali Metals ]

- They are the most reactive metals.
- They react violently with water.
- Alkali metals are never found as free elements in nature. They are always bonded with another element.

# What does it mean to be reactive?

- We will be describing elements according to their reactivity.
- Elements that are reactive bond easily with other elements to make compounds.
- Some elements are only found in nature bonded with other elements.
- What makes an element reactive?
  - An incomplete valence electron level.
  - All atoms (except hydrogen) want to have 8 electrons in their very outermost energy level (This is called the rule of octet.)
  - Atoms bond until this level is complete. Atoms with few valence electrons lose them during bonding. Atoms with 6, 7, or 8 valence electrons gain electrons during bonding.

Sodium

1 valence  
electron

Chlorine

7 valence  
electrons

Sodium

Chlorine

Sodium loses one electron.  
Chlorine gains one electron.

# Sodium Chloride

# [ Transition Metals ]

- Transition Elements include those elements in the B families.
- These are the metals you are probably most familiar: copper, tin, zinc, iron, nickel, gold, and silver.
- They are good conductors of heat and electricity.

Periodic Table of the Elements

The diagram shows a periodic table with the following structure:

- Group 1: 1 element
- Group 2: 1 element
- Transition Metals (d-block): 10 elements, highlighted in blue, spanning 4 rows.
- Group 11: 1 element
- Group 12: 1 element
- Group 13: 1 element
- Group 14: 1 element
- Group 15: 1 element
- Group 16: 1 element
- Group 17: 1 element
- Group 18: 1 element
- f-block: 14 elements, shown in two rows of 7, highlighted in blue.

# [ Transition Metals ]

- The compounds of transition metals are usually brightly colored and are often used to color paints.
- Transition elements have 1 or 2 valence electrons, which they lose when they form bonds with other atoms. Some transition elements can lose electrons in their next-to-outermost level.

# [ Transition Elements ]

- Transition elements have properties similar to one another and to other metals, but their properties do not fit in with those of any other family.
- Many transition metals combine chemically with oxygen to form compounds called oxides.

# [ Carbon Family ]

- Atoms of this family have 4 valence electrons.
- This family includes a non-metal (carbon), metalloids, and metals.
- The element carbon is called the “basis of life.” There is an entire branch of chemistry devoted to carbon compounds called organic chemistry.

Periodic Table of the Elements

The image shows a simplified periodic table of elements. The elements are represented by gray squares. The carbon family, consisting of groups 14 and 15, is highlighted in yellow. The table is arranged in four rows. The first row has 2 elements, the second row has 8, the third row has 18, and the fourth row has 18. The carbon family is located in the second column from the right of the main body of the table.

# [ Mendeleev ]

- In 1869, Dmitri Ivanovitch Mendeléeév created the first accepted version of the periodic table.
- He grouped elements according to their atomic mass, and as he did, he found that the families had similar chemical properties.
- Blank spaces were left open to add the new elements he predicted would occur.

# [ Matter ]

- All matter is composed of atoms and groups of atoms bonded together, called molecules.
  - Substances that are made from one type of atom only are called pure substances.
  - Substances that are made from more than one type of atom bonded together are called compounds.
  - Compounds that are combined physically, but not chemically, are called mixtures.

# Elements, Compounds, Mixtures

- Sodium is an element.
- Chlorine is an element.
- When sodium and chlorine bond they make the compound sodium chloride, commonly known as table salt.

- Compounds have different properties than the elements that make them up.
- Table salt has different properties than sodium, an explosive metal, and chlorine, a poisonous gas.

# Elements, Compounds, Mixtures

- Hydrogen is an element.
- Oxygen is an element.
- When hydrogen and oxygen bond they make the compound water.
- When salt and water are combined, a mixture is created. Compounds in mixtures retain their individual properties.

The ocean is  
a mixture.

# Elements, compounds, and mixtures

- Mixtures can be separated by physical means.
- Compounds can only be separated by chemical means.
- Elements are pure substances. When the subatomic particles of an element are separated from its atom, it no longer retains the properties of that element.
